Project Summary: Phishing Risk Assessment for SecureTech

I completed a risk assessment for a recent phishing attempt that targeted employees in SecureTech's Finance Department. The phishing email contained a malicious link with the potential to expose sensitive financial information and allow unauthorized access to internal systems. I evaluated the **likelihood** of the phishing attempt leading to a breach—considering that the attack was detected but not all employees were aware before interacting with it. I also assessed the **potential impact** of a successful breach. Based on this evaluation, I rated both the likelihood and impact levels and documented the results in the risk matrix for review.
