Project Summary: SecureTech Asset Inventory Assessment

I completed a critical asset inventory for SecureTech by identifying key data, systems, applications, hardware, and third-party platforms essential to business operations. Each asset was categorized based on its potential impact if compromised:

- **High-Impact Assets** included customer financial data, CRM systems, internal servers, and security tools such as SIEM and firewalls.
- **Medium-Impact Assets** consisted of HR and inventory systems, cloud storage, and certain business applications.
- **Low-Impact Assets** included peripheral systems and devices with minimal operational impact.

The categorized asset list was documented in a Google Sheets inventory and submitted for review. This inventory will serve as the foundation for applying targeted security controls in alignment with the next phase of the NIST Cybersecurity Framework.
